

Manufacturing Watchlist Momentum Report

Khlood alZubi

Summary

This report asks: **which major manufacturing and industrial companies showed the strongest recent stock momentum compared with their peers?** The watchlist contains MMM, HON, DE, GE, CAT and uses Twelve Data daily historical prices from 2026-06-17 through 2026-07-30.

The strongest performer over this collected period was **MMM**, with a period return of 10.69%. The weakest performer was **CAT**, with a period return of -15.43%. Across the watchlist, the average period return was 0.31%.

Data Source And Parameters

- Source API: Twelve Data `/time_series` and `/quote` endpoints.
- Historical interval: `1day`.
- Historical output size: 30 observations per symbol in the committed data.
- Watchlist: MMM, HON, DE, GE, CAT.
- Units: prices are in U.S. dollars per share where `currency` is USD; returns are percentages.
- Report render date: 2026-07-31 02:50 UTC.
- Input files: `data/processed/manufacturing_watchlist_history.csv`, `data/processed/manufacturing_watchlist_prices.csv` and `data/processed/manufacturing_watchlist_quotes.csv`.

Momentum Ranking

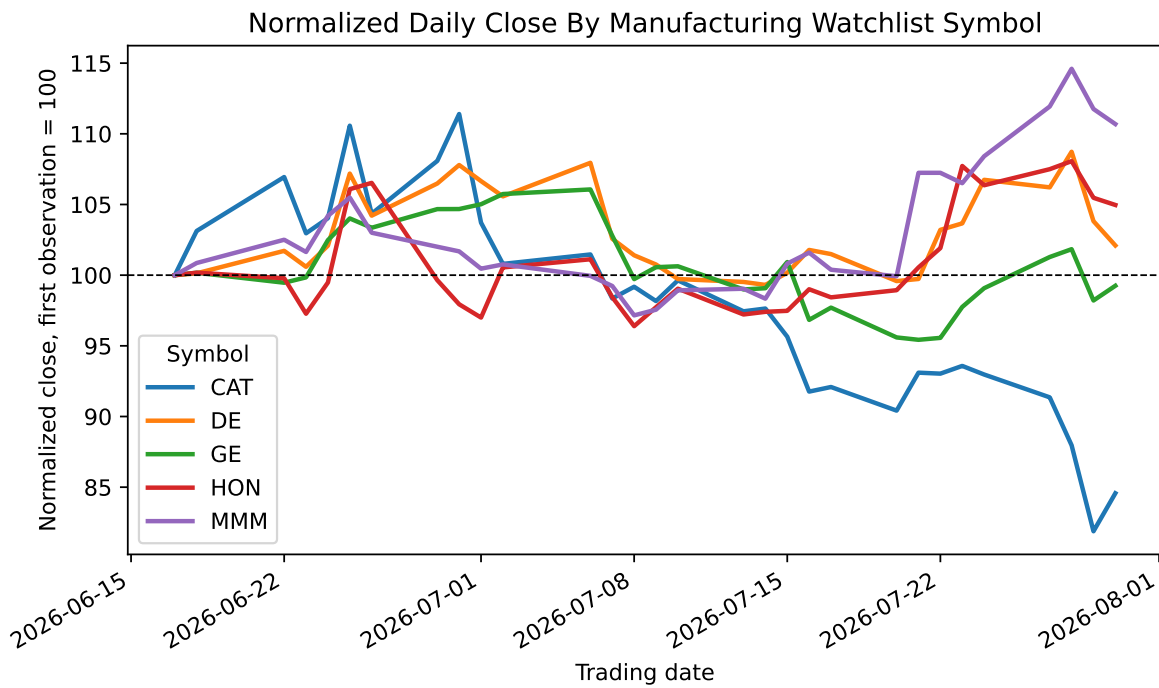

The table ranks symbols by period return from strongest to weakest. It keeps the report view focused on the core comparison: return, price range, and observation count.

	Symbol	Return %	Range %	Days
0	MMM	10.69	17.45	30
1	HON	4.96	11.67	30

	Symbol	Return %	Range %	Days
2	DE	2.10	9.42	30
3	GE	-0.75	10.64	30
4	CAT	-15.43	29.52	30

Normalized Price Trend

The figure indexes each symbol's first closing price to 100. Values above 100 mean the symbol rose relative to its starting point; values below 100 mean it fell.

Interpretation

The watchlist shows a mixed short-term manufacturing-sector picture. 3 symbols had positive period returns, while 2 symbols were negative and 0 were flat. The normalized trend makes the comparison clearer because all symbols start from the same baseline, so the report emphasizes relative movement rather than raw share price.

This report is not investment advice. It is a reproducible project artifact that demonstrates how the tool collects raw API evidence, validates and processes it, and turns the processed data into an analytical comparison.

Rebuild Command

After restoring the project environment, rebuild this PDF with:

```
quarto render reports/manufacturing_momentum.qmd --to pdf
```
